The name AutoCAD is an acronym for the computer-aided design program Auto-Cad. Auto-Cad stands for "Auto Computer-Aided Design". AutoCAD is designed to make it easier to create, manipulate, and display drawings and other design elements, and its function is divided into the following categories: Printing, viewing, and rendering of objects Graphic creation tools Structural tools Sheet metal tools Functions that don't fit in these categories are mostly related to the AutoCAD history and its development. Contents show] History Origins AutoCAD was developed in the late 1970s by Arthur Donaldson, creator of the first commercially available CAD system. It was originally known as the Data Design System (DDSP) and first shipped in 1980. When it was first released, its name was AutoCAD. In 1988, Arthur Donaldson left the company to form his own company, A.D. Design. In 1996, the company was acquired by 3D Systems. After being acquired by Autodesk in 1999, the name was changed to AutoCAD. Origins Early versions of AutoCAD were written in Basic, a programming language developed at MIT in the 1960s. Although Basic is obsolete, some of the code that drove early versions of AutoCAD is still in use, making it possible to operate older versions of AutoCAD using a DOS emulator or an old MS-DOS or Amiga emulator (see, e.g., Version 1.1). In the late 1980s, all but the very earliest versions of AutoCAD used the new Graphical User Interface (GUI), first implemented on MS-DOS in 1984 and then on other operating systems including Microsoft Windows. As for most versions of AutoCAD, the earliest versions (1.0 to 1.1) used the 2-D Basic interface, with 2-D cursor-based commands and menus. Later versions, starting with version 1.2, incorporated the Graphic Modeling System (GMS), which allowed users to create a design model in three dimensions, providing the capability to move in three dimensions and to define the objects used in the model. Variants The original AutoCAD was a version of the Autodesk Discreet AutoCAD, which was a version of the Data Design System created by Arthur Donaldson in the late 1970

3D modeling 3D Modeling within the AutoCAD program is accomplished through the use of a graphics tablet, a laser pointer, or a mouse to click points, lines, circles, and polygons. The information is saved on the computer in the DWG format. 2D drafting 2D drafting is primarily accomplished using a mouse, which is used to click or draw on the document. A dialog box opens allowing you to change the properties of that particular line, and when you're done, the line is moved back to the default line. When the user selects the Change Line option, the line appears in a different color, depending on what object the line is connected to. To create multiple lines, they are created by simply clicking on a section of the paper. A dialog box opens allowing the user to add one or more lines. When the user is finished, the lines are connected to other points on the drawing or to another line. When the user clicks on the "Close Line" or "Close Polyline" buttons, the lines or polylines disappear from the drawing. 2D drawing Users may also draw 2D objects, or they may simply select a color and click to fill in the area. When the user selects the Fill Color option, the fill color is selected and the fill pattern is selected, and when the user is done, the fill pattern is saved for the color. Alternatively, users may apply a global fill or a hatch fill. If there are several areas to be filled, they can be combined using hatch fills. When the user is finished, the fill, hatch, or fill and hatch colors are saved. There is no standard for how users represent lines on drawings. The drawing ruler and Dynamic Input help with that, as they provide a standard for horizontal and vertical space. Fields The objects that can be created in the drawing window can be divided into several types. Text objects: These are created to represent textual information. They appear as ordinary character objects and, as a group, can

be manipulated by the user. A typical example is the Text object representing a dimension name. Some drawing objects cannot be manipulated as text objects. The Copy, Paste and Cut operations may only be performed on some objects. Block objects:
