Email a friend To From Thank you Sorry An email interview with Alan Seale, a systems architect at Raytheon, about what teams should do if they find themselves in a state of "crisis." It's a word that seems to have many meanings: a period of chaos, a situation in which resources are scarce or poorly balanced, when things are out of control. It is sometimes used as a synonym for depression or panic. It is also commonly used in information technology, particularly in communications. IT Crisis Management is the term used to define the actions required to address a problem when the normal system functions are impaired, and a more serious event may be occurring. We should just pause and think for a second about what crisis means, and how we might have handled certain key issues in the past, because we usually have good reasons for doing things the way we did. Let's think about the original definition: "A period of unusual or pronounced change, activity, excitement, urgency, or danger." There is no requirement in that definition for any sort of physical crisis. The word crisis is also used in a number of other circumstances. It is not limited to a crisis of a particular event or circumstance, as the word disaster is. It is widely used in healthcare, as in the case of a medical crisis. In work, it is used to refer to an event when performance metrics change so that compliance with regulation is in danger. When I worked for a national communications company, we were trained in crisis management, but it was always with reference to the crisis of a competitor that posed a threat to the organization. When you talk about IT crisis management, it is a subset of the broader discipline of crisis management. The big difference is that in a business or enterprise, you usually have a clear situation and reason for the crisis. If you are in trouble, you are in a crisis. You need to take an immediate series of actions to deal with the situation. A good crisis manager will generally issue a crisis plan, which is a document that defines the crisis plan, and the plan is to work in such a way as to mitigate the effects of the situation. This would normally be something of a standard operating procedure, although it will be updated periodically so that it applies effectively to the current situation. The crisis plan generally includes a set of questions that you need to answer to figure
